Approach

In choosing investments, the Investment Manager starts with a broad regional universe of stocks and shortlists them on the basis of investability and desirable characteristics (e.g. value and positive analyst sentiment, among other factors). Portfolio construction and stock selection are quantitative, with an optimisation process applied to derive the optimal weights to construct a low volatility portfolio from an investable universe. A number of constraints such as maximum individual stock weight, portfolio concentration, liquidity, sector, country and style exposures, etc. are applied in order to manage systematic and stock-specific risk
